

# *What is Up with Inventories?*

*Connecticut Urban Forest  
Council Conference 2011*

*Chris Donnelly, CT DEEP*

*and*

*Dr. Dave Bloniarz, USFS*

*Distinguish among:*

*Inventories*

*Surveys*

*Samples*

*Assessments*

*Analyses*

*What is the purpose of  
this inventory /  
survey / sample /  
assessment /  
analysis?*

*Why are we conducting these studies?  
What do we hope to get out of this effort?*

# *Public Trees / Private Trees*

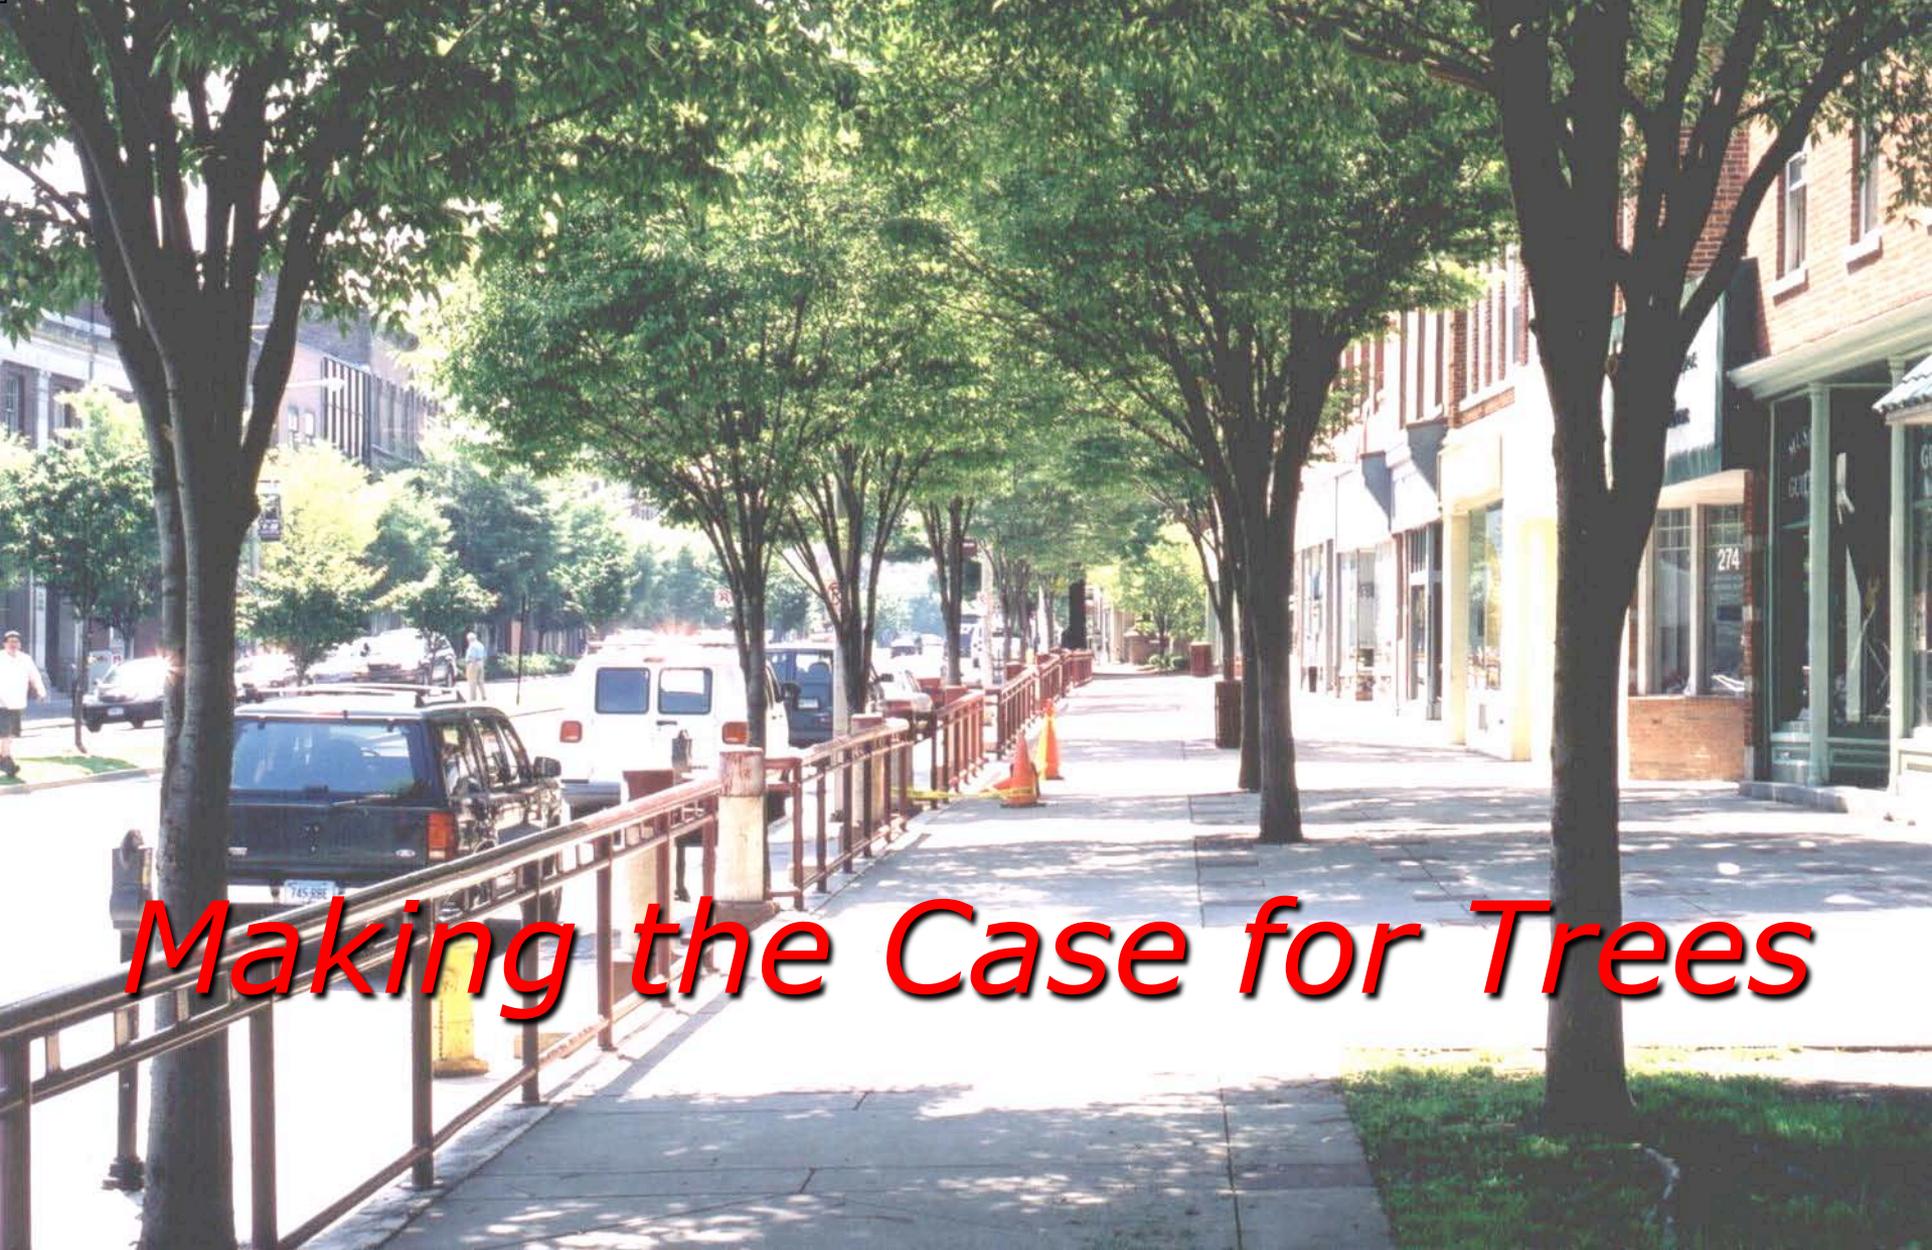

# *Are we trying to:*

- *Better Describe the Urban Forest*
- *Communicate Information Regarding the Urban Forest*
  - *Influence Policy*
  - *Increase Public Involvement*
  - *Improve Management Practices*
- *Gain a Better Understanding of How the Urban Forest Functions*

# *Trees are Good*

# *Numbers in the Urban Forest*

*Making the Case for Trees*

# *Collecting the Numbers*

- *Inventories*
- *iTree Tools*
- *Urban Tree Canopy Assessments*

# ***Why Inventory?***

- ***You can't manage it if you don't know you have it***
  - ***It is an effective way to describe the importance of the urban forest resource***
- ***It is always worthwhile to look closely at trees***
- ***You are establishing a baseline by which you can measure the progress of your program***
- ***If you don't know you have it, it's too easy to lose it***

# *High Hopes for Street Tree Inventories*

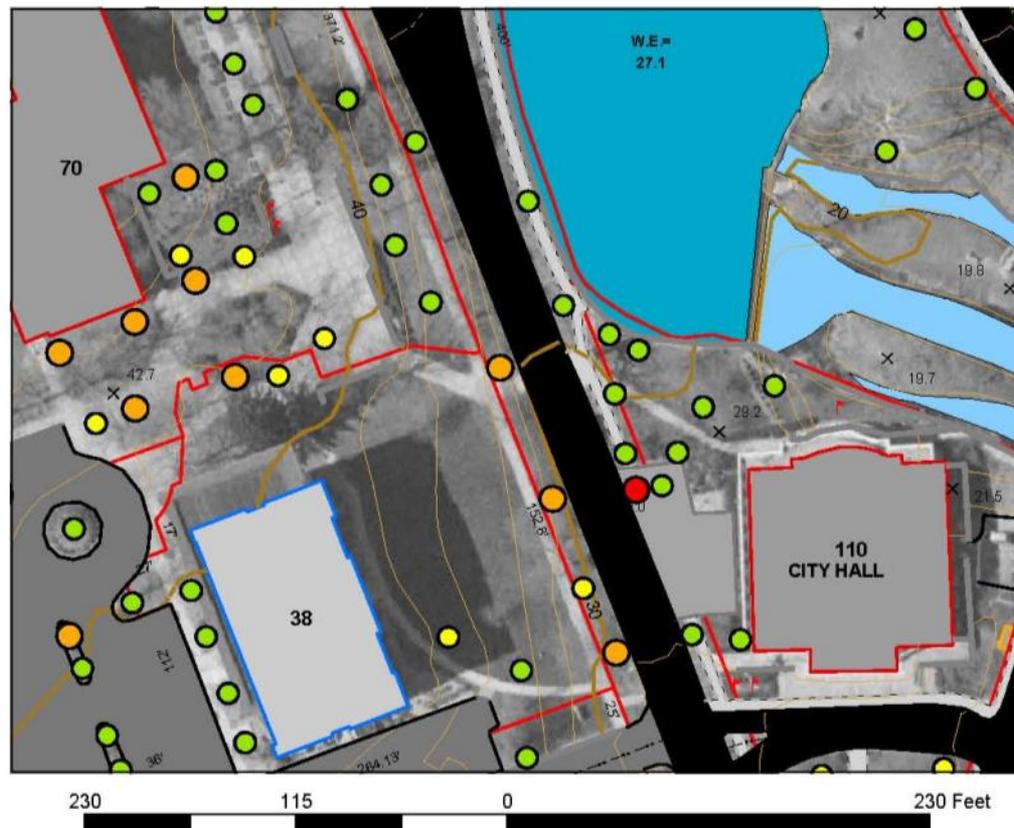

## *Circa the Year 2000*

- *100% Street Tree Inventories as a management tool – great for planning, record-keeping, forecasting, etc.*
  - *Street Tree Inventories as a communications tool – what do we have, what it going on with it, why it is important and what it will cost to manage*
- *Inventories as opportunities for education and outreach*

# Milford Street Trees - Species Distribution

**That's great, but....**

**...what progress are we making?**

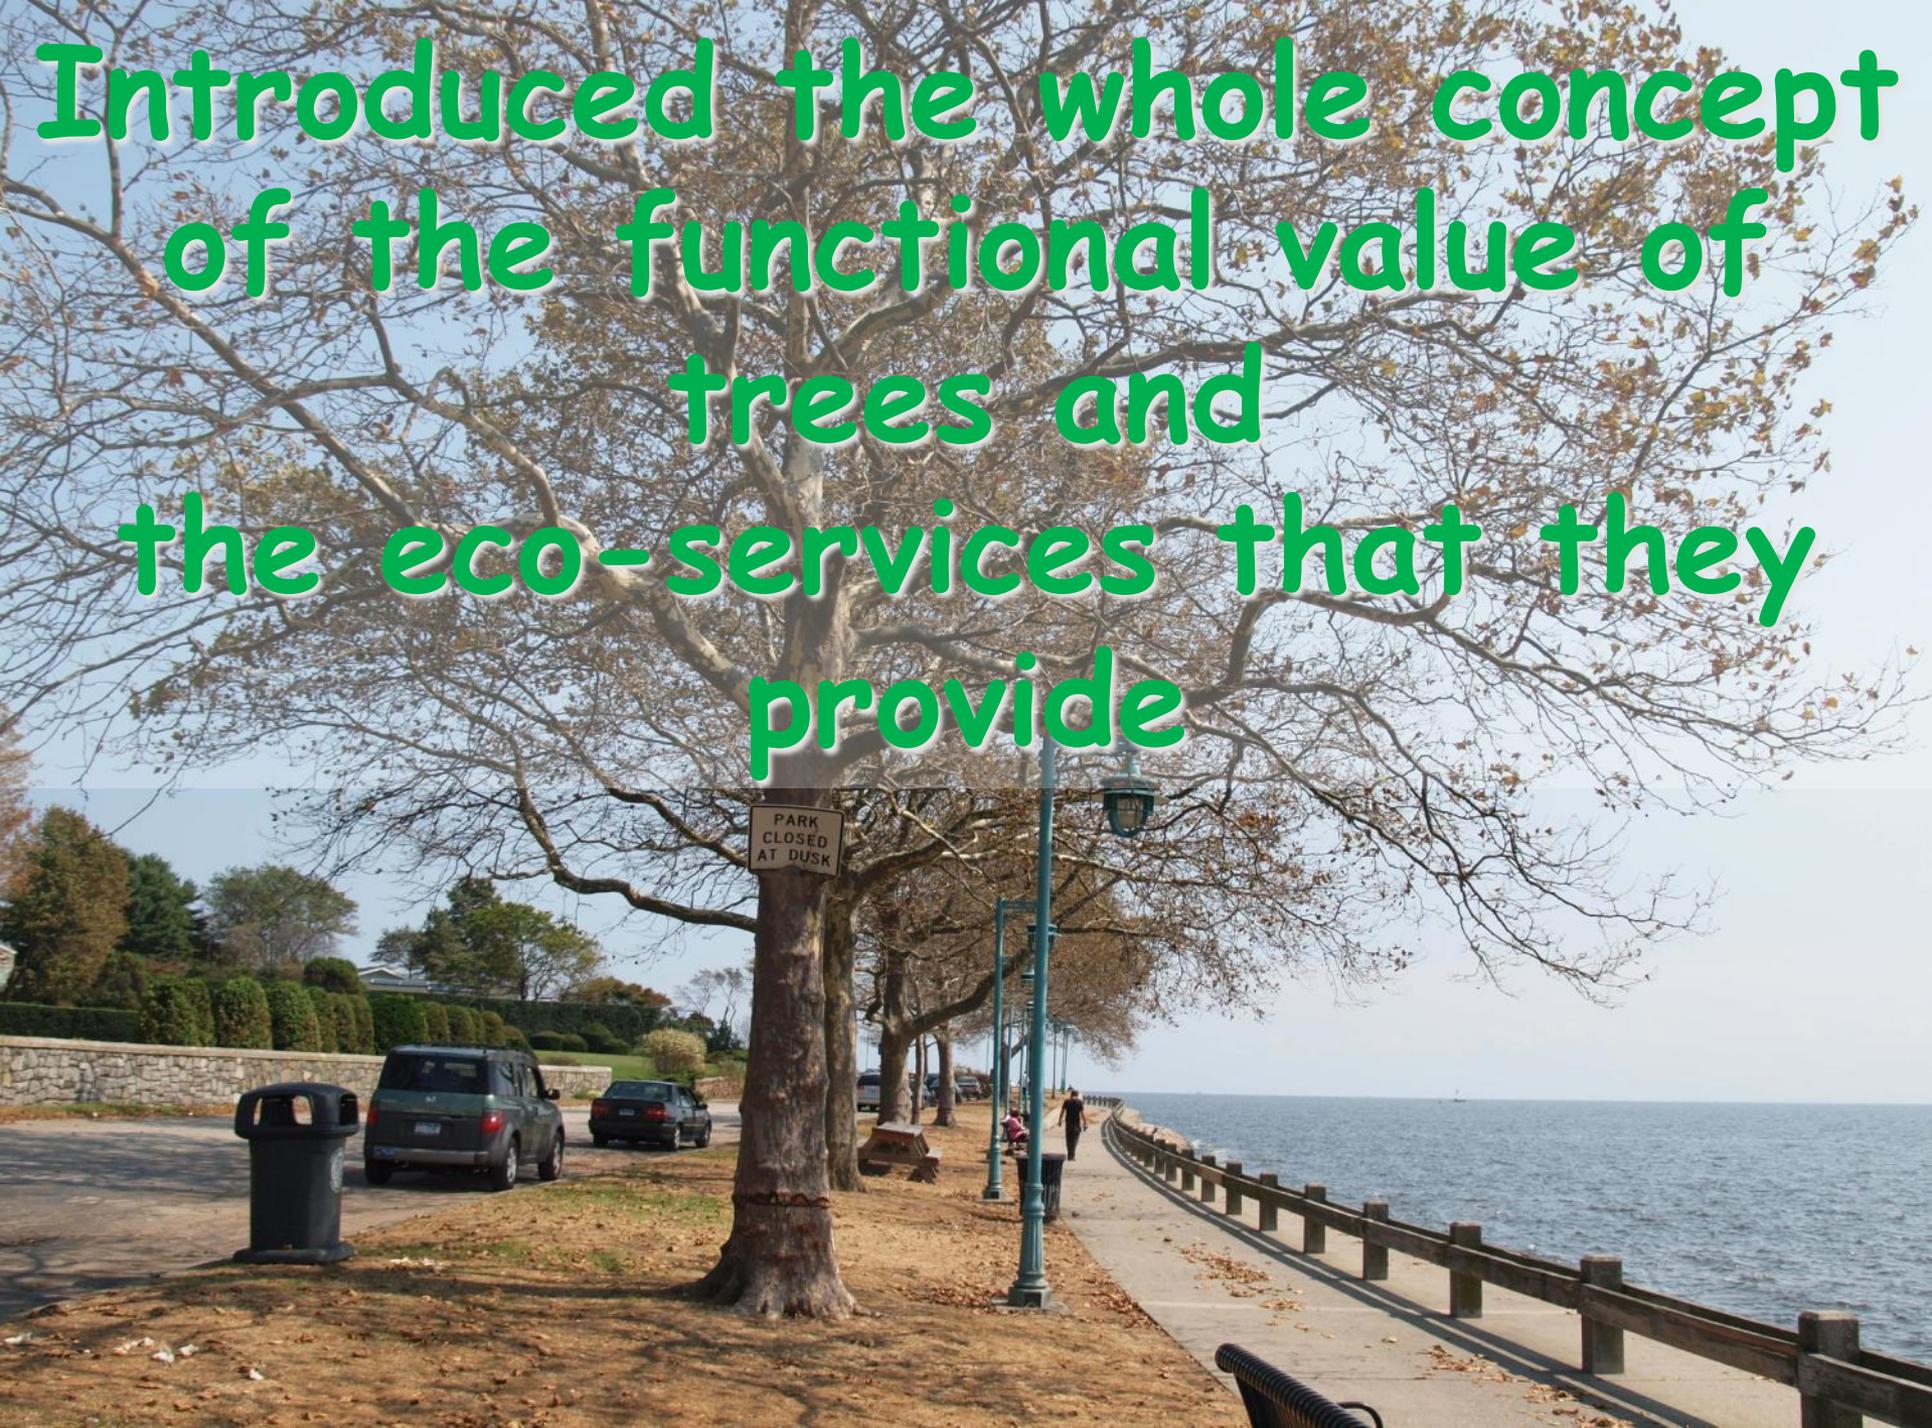

# i-Tree Tools:

**UFORE**  
(now i-Tree Eco)

and

**STRATUM**  
(now i-Tree Streets)

Introduced the whole concept  
of the functional value of  
trees and  
the eco-services that they  
provide

**UFORE:**

**Urban Forest  
Effects Model**

**(iTree-Eco)**

# UFORE assesses the:

Structure of the urban forest - what kinds of trees, of what size, condition, where these trees are located, etc.

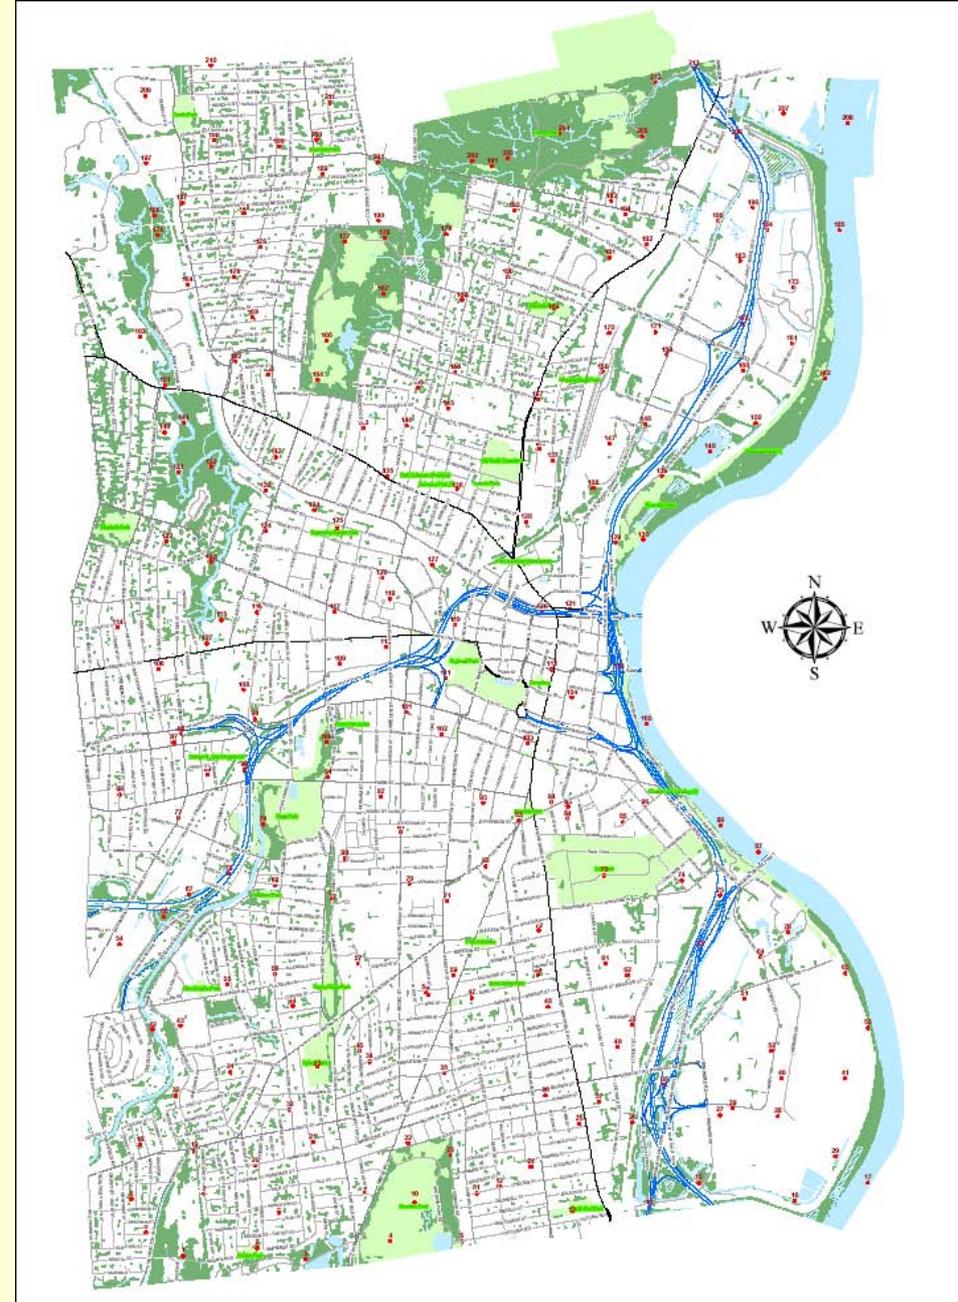

Function of the urban forest - what types of services do trees provide - such as air quality effects, energy reduction, etc.

# UFORE also assesses:

**Structural value of the urban forest - essentially, what would it cost to replace this forest?**

**Functional value of the urban forest - what would society be willing to pay for the service provided by trees (e.g. - air pollution removal or value of energy saved).**

# Randomized Grid - 213 points total

# General Numbers on Hartford's Trees

<b>Total Number of Trees:</b>	<b>567,992</b>
<b>Number of Trees &gt;4" dbh:</b>	<b>267,840</b>
<b>Number of Trees &gt;10 " dbh:</b>	<b>140,544</b>
<b>Number of Trees &gt;20" dbh:</b>	<b>55,296</b>

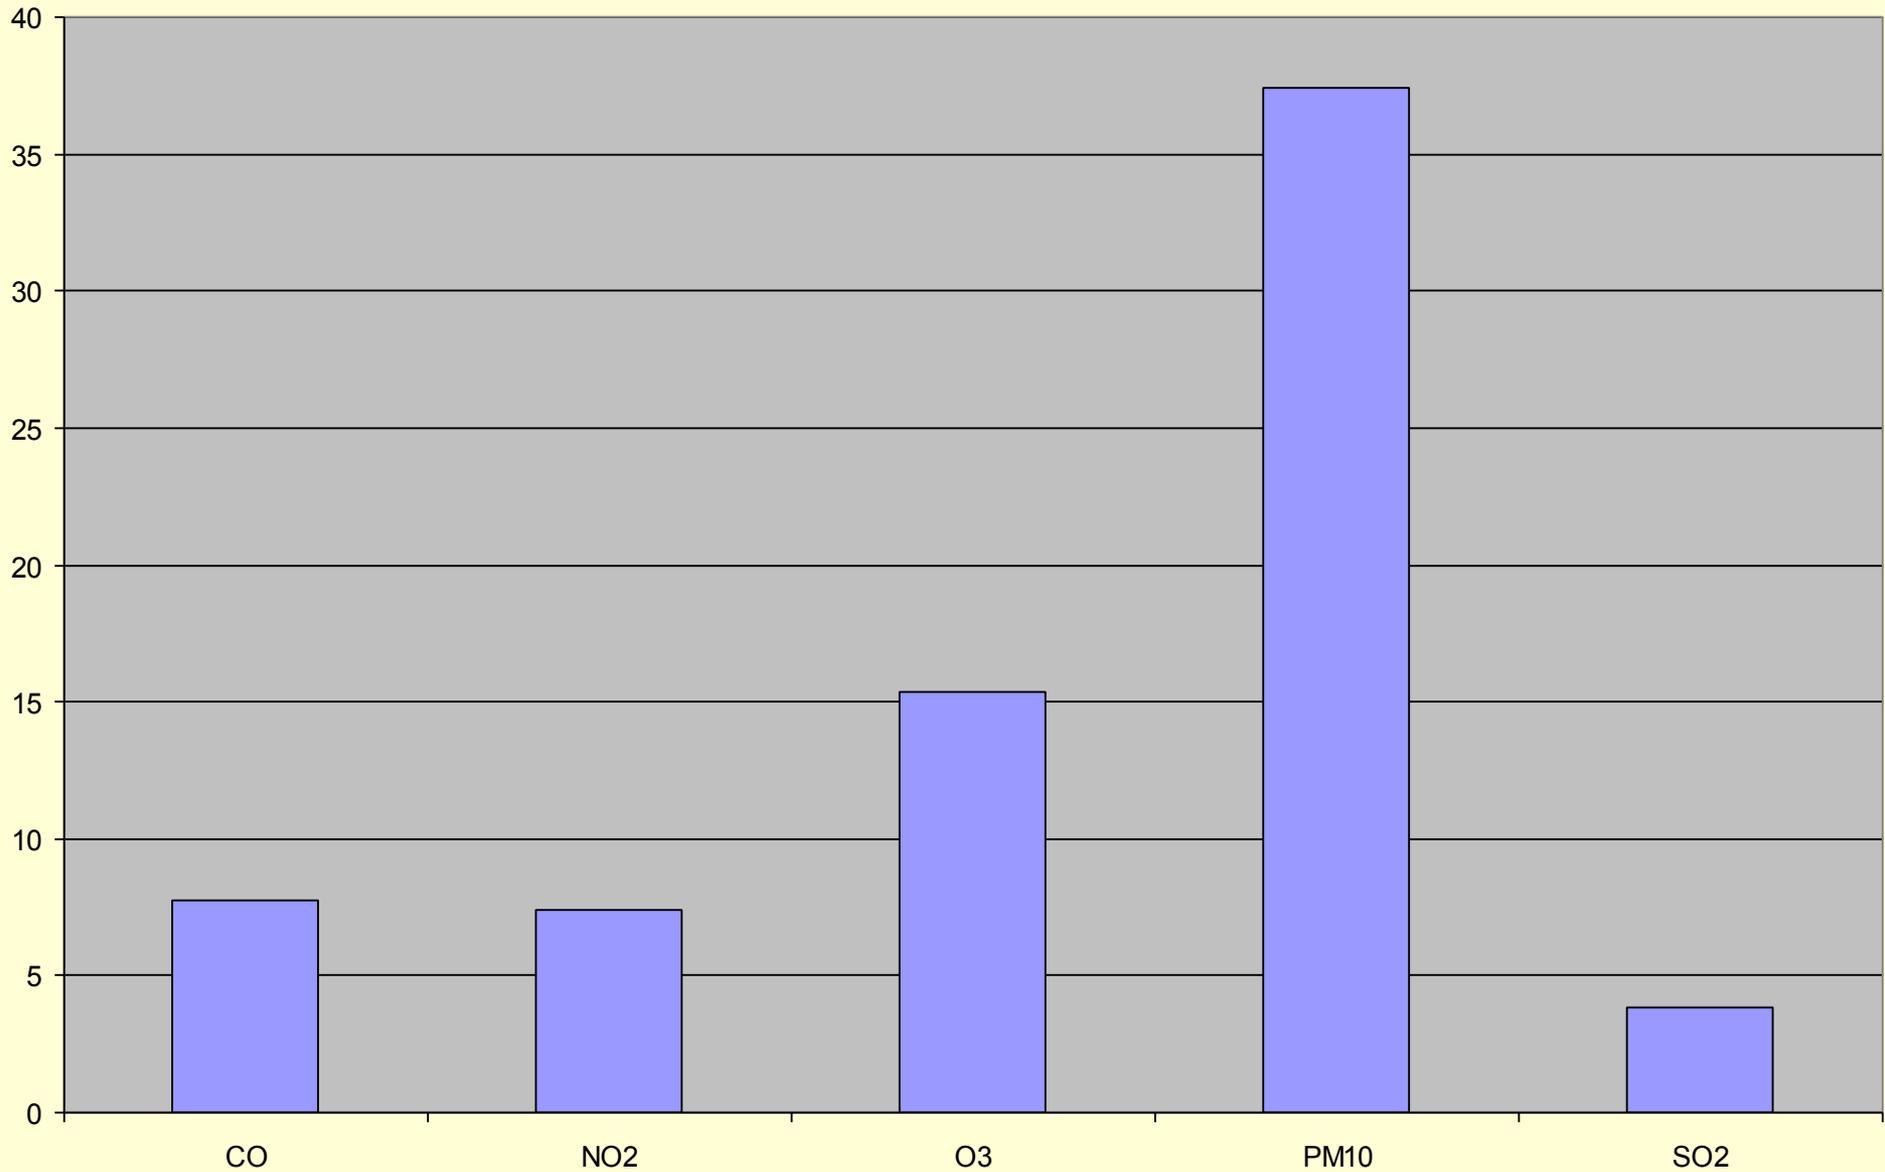

# Hartford - All Trees - Species Distribution

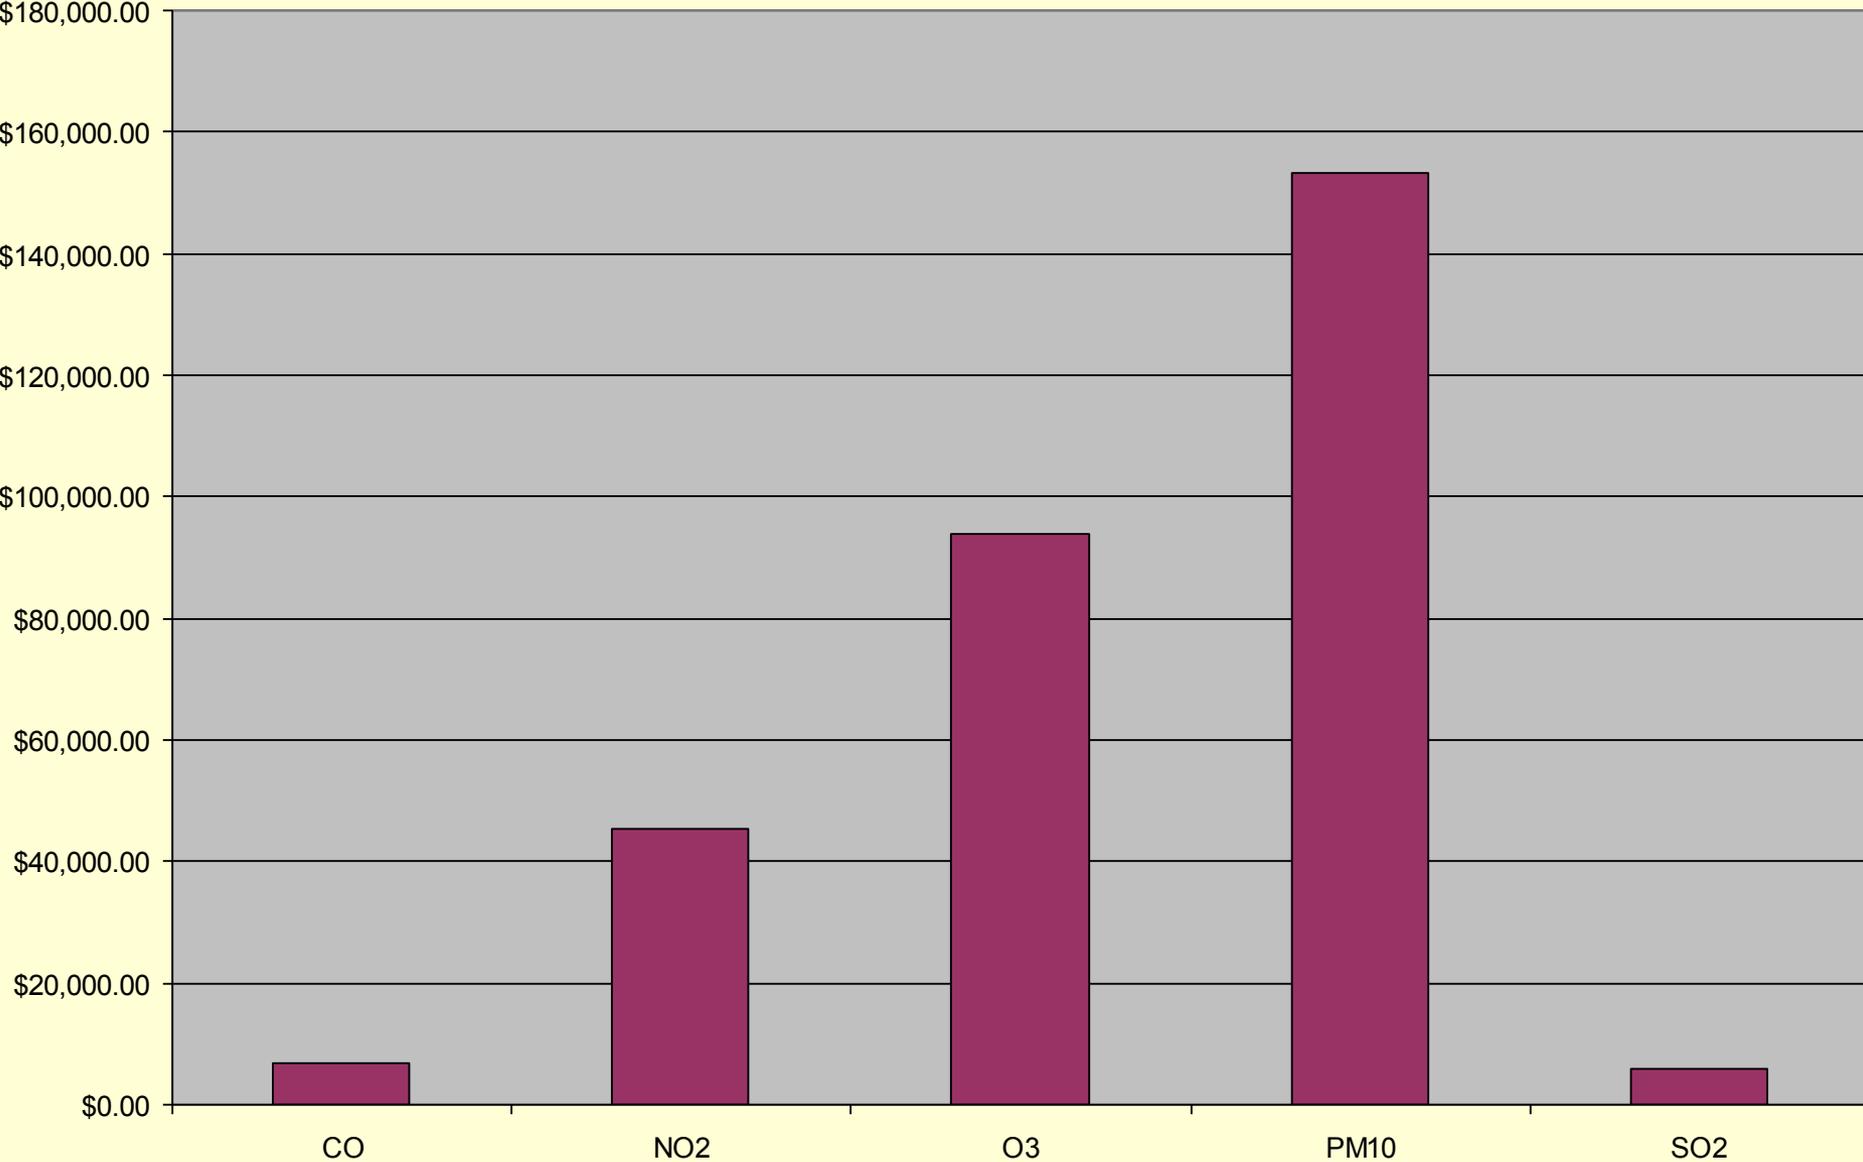

Replacement Value of  
Hartford's Trees =  
\$589,177,284

Functional Value of  
Hartford's Trees in air  
quality alone =  
\$304,884/year

# Hartford Data - Pollutants Removed Annually - Tons

# Hartford Data - Pollutants Removed Annually - Value in Dollars

## **Hartford's Urban Forest - a Summary**

**Number of Trees:** 568,000

**Number of Larger Trees** (over 20" in diameter): 55,000

**Most Common Trees:** red maple, tree of heaven, black cherry, American elm and red oak

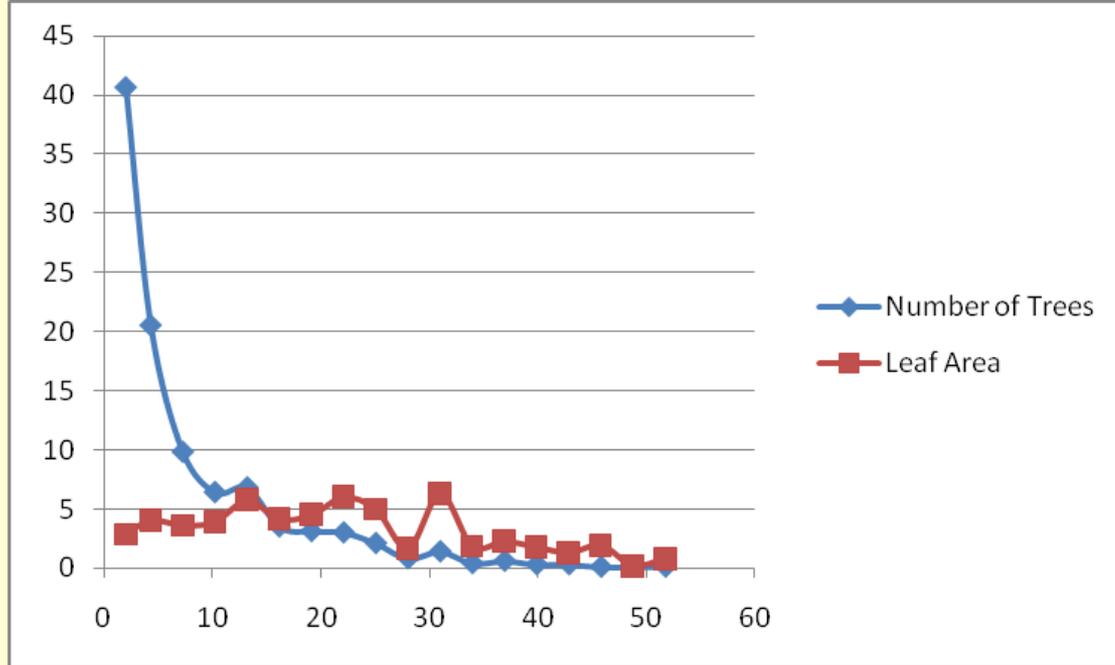

**Tree Canopy Cover:** 26%

**Amount of Carbon Removed by Hartford's Trees Annually:** 2,440 tons

**Amount of Major Air Pollutants Removed Annually:** 73 tons

**Oil Saved due to Energy Reduction by These Trees:** 2,400 barrels a year

**Replacement Cost for These Trees:**  
\$590 million dollars

**Comparison of percentages by dbh class**

- 20% of Hartford’s trees are 12 inches in diameter or greater
- 5% of Hartford’s trees are 24 inches in diameter or greater
- 2% of Hartford’s trees are 36 inches in diameter or greater

However:

- 75% of the leaf area of Hartford’s trees are in trees 12 inches in diameter or greater
- 40% of the leaf area of Hartford’s trees are in trees 24 inches in diameter or greater
- 14% of the leaf area of Hartford’s trees are in trees 36 inches in diameter or greater

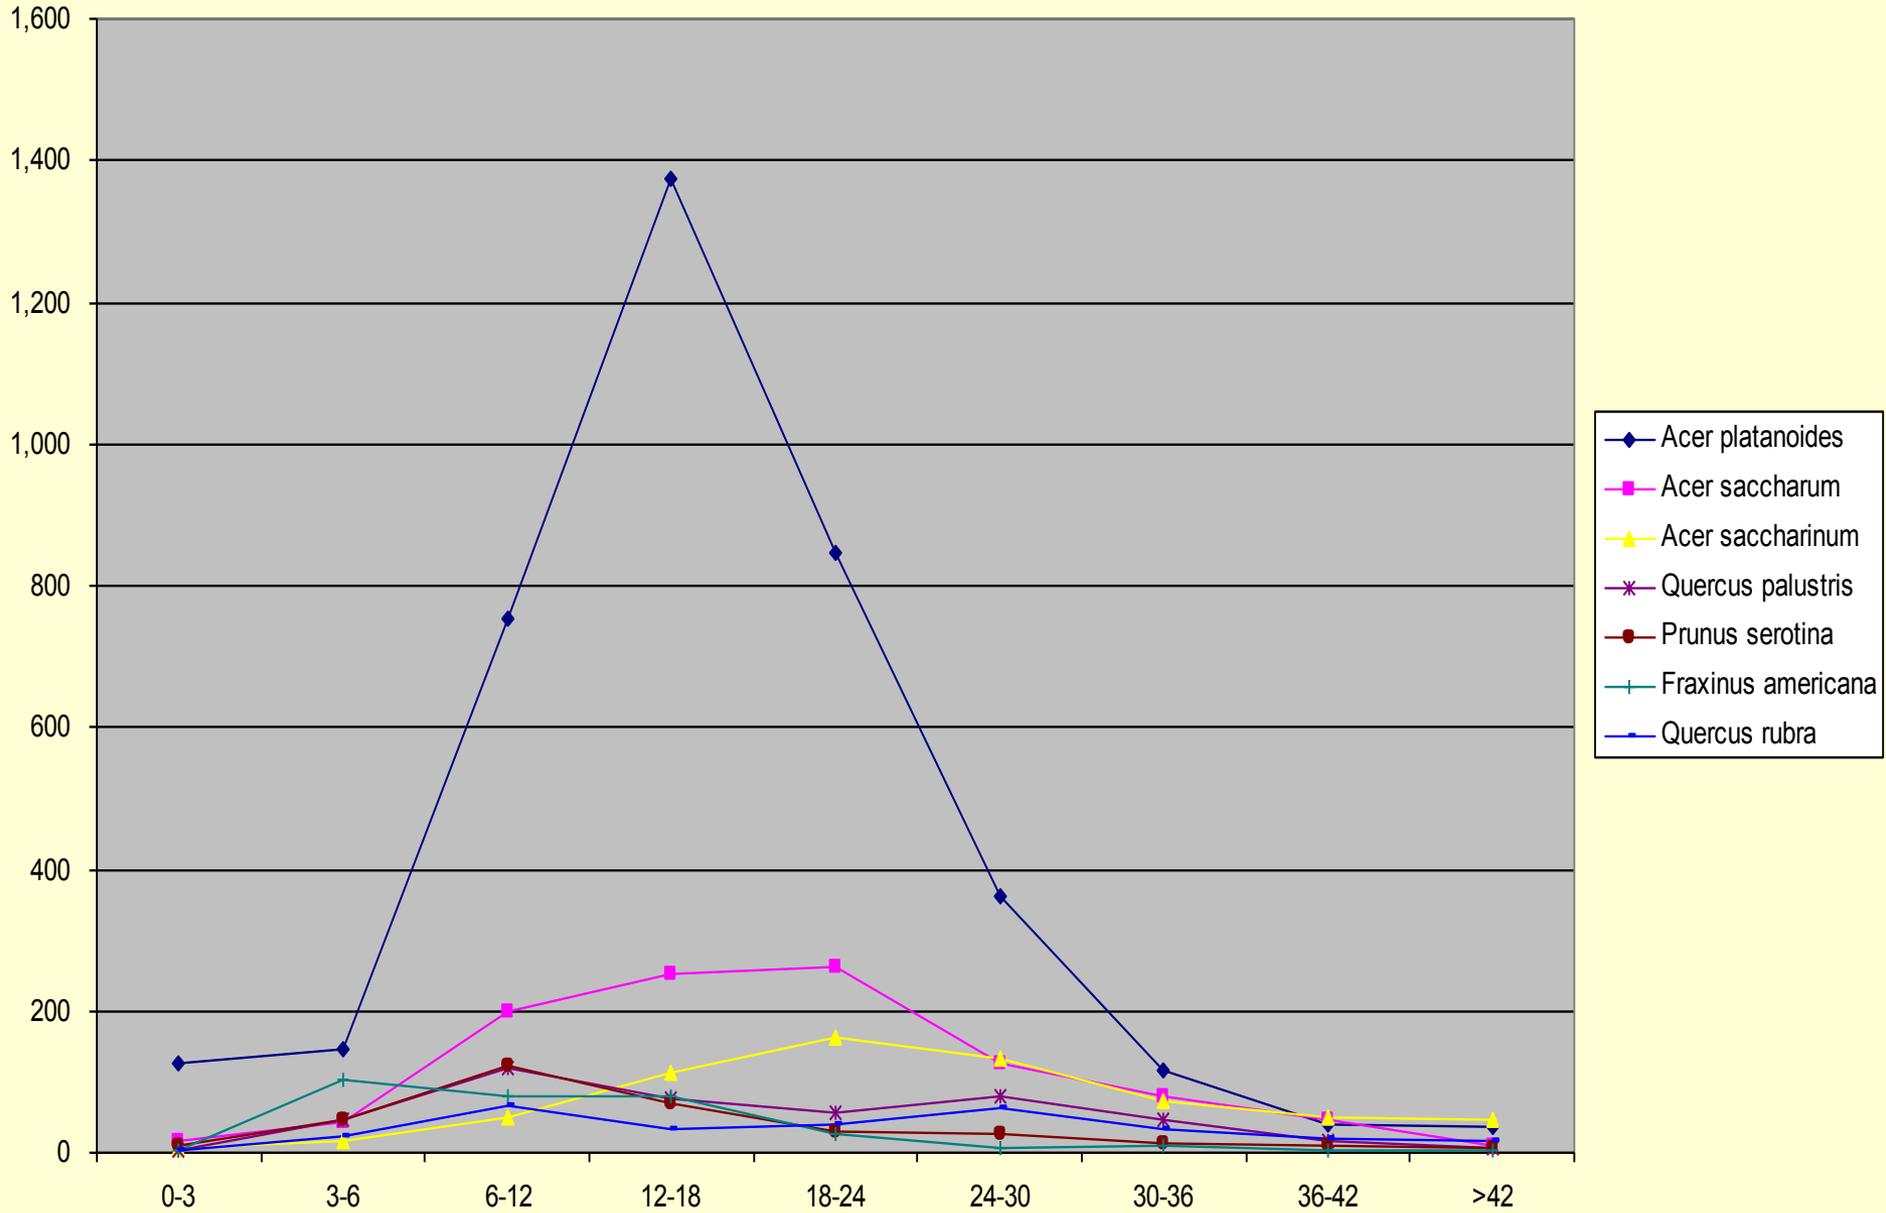

Leaf area is the main determinant of the capability of an individual trees to deliver such benefits as air pollution reduction, stormwater reduction and so on.

## A Report on the City of New Haven's Existing and Possible Urban Tree Canopy

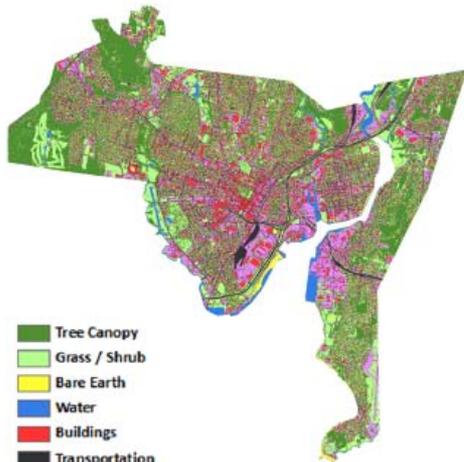

### Why is Tree Canopy Important?

Urban tree canopy (UTC) is the layer of leaves, branches, and stems of trees that cover the ground when viewed from above. Urban tree canopy provides many benefits to communities, including improving water quality, saving energy, lowering city temperatures, reducing air pollution, enhancing property values, providing wildlife habitat, facilitating social and educational opportunities, and providing aesthetic benefits. Establishing a UTC goal is crucial for those communities seeking to improve their green infrastructure. A UTC assessment that estimates the amount of tree canopy currently present (Existing UTC), along with the amount of tree canopy that could theoretically be established (Possible UTC), is the first step in the UTC goal-setting process.

### How Much Tree Canopy Does New Haven Have?

An analysis of New Haven's urban tree canopy based on land cover derived from high-resolution aerial imagery (Figure 1) found that more than 4,468 acres of the city were covered by tree canopy (termed Existing UTC) representing 38% of all land in the city. An additional 41% (4,824 acres) of the city could theoretically be improved (Possible UTC) to support tree canopy (Figure 2). In the Possible UTC category, 21% (2,480 acres) of the city were Impervious Possible UTC and another 20% were Vegetated Possible UTC (2,344 acres). Vegetated Possible UTC, or grass and shrubs, is more conducive to establishing new tree canopy, but establishing tree canopy on Impervious Possible UTC will have a greater impact on water quality.

- Transportation
- Pavement

Figure 1: Land cover derived from high-resolution aerial imagery for the City of New Haven.

### Project Background

The analysis of New Haven's urban tree canopy (UTC) was carried out in collaboration with the City of New Haven, the Urban Resources Initiative at the Yale School of Forestry & Environmental Studies, The University of Connecticut's Center for Land Use Education & Research, and the State of Connecticut Department of Environmental Protection. The analysis was performed by the Spatial Analysis Laboratory (SAL) of the University of Vermont's Rubenstein School of the Environment and Natural Resources, in consultation with the USDA Forest Service's Northern Research Station.

The goal of the project was to apply the USDA Forest Service's UTC assessment protocols to the City of New Haven. This analysis was conducted based on year 2008 data.

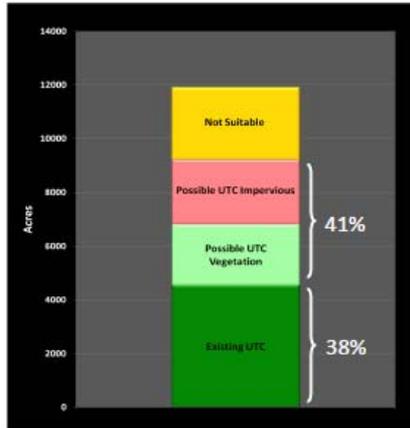

Figure 2: UTC metrics for New Haven based on % of land area covered by each UTC type.

### Key Terms

**UTC:** Urban tree canopy (UTC) is the layer of leaves, branches, and stems of trees that cover the ground when viewed from above.  
**Land Cover:** Physical features on the earth mapped from aerial or satellite imagery, such as trees, grass, water, and impervious surfaces.  
**Existing UTC:** The amount of urban tree canopy present when viewed from above using aerial or satellite imagery.  
**Impervious Possible UTC:** Asphalt or concrete surfaces, excluding roads and buildings, that are theoretically available for the establishment of tree canopy.  
**Vegetated Possible UTC:** Grass or shrub area that is theoretically available for the establishment of tree canopy.

## A Report on the City of Hartford, Connecticut's Existing and Possible Tree Canopy

### Why is Tree Canopy Important?

Tree canopy (TC) is the layer of leaves, branches, and stems of trees that cover the ground when viewed from above. Tree canopy provides many benefits to communities, including improving water quality, saving energy, lowering city temperatures, reducing air pollution, enhancing property values, providing wildlife habitat, facilitating social and educational opportunities, and providing aesthetic benefits. Establishing a TC goal is crucial for communities seeking to improve their green infrastructure. A TC assessment is the first step in this goal-setting process, providing estimates for the amount of tree canopy currently present in a municipality as well as the amount of tree canopy that could theoretically be established.

### How Much Tree Canopy Does Hartford Have?

An analysis of Hartford's tree canopy based on land cover derived from high-resolution aerial imagery (Figure 1) found that more than 2,870 acres of the city were covered by tree canopy (termed Existing TC), representing 26% of all land in the city. An additional 49% (5,488 acres) of the city could theoretically be modified (Possible TC) to accommodate tree canopy (Figure 2). In the Possible TC category, 25% (2,778 acres) of the city was classified as Impervious Possible TC and another 24% was Vegetated Possible TC (2,711 acres). Vegetated Possible TC, or grass and shrubs, is more conducive to establishing new tree canopy, but establishing tree canopy on Impervious Possible TC will have a greater impact on water quality.

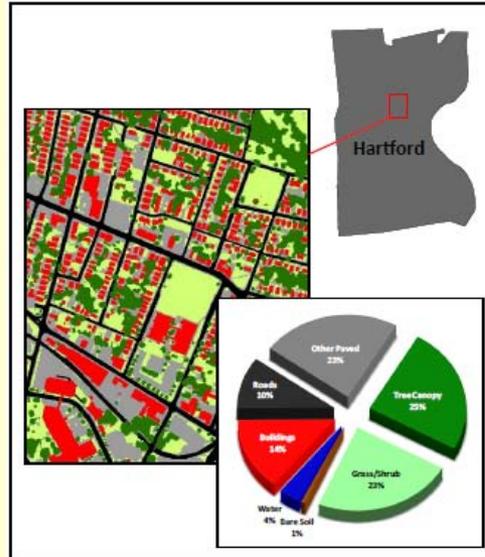

Figure 1: Land cover derived from high-resolution aerial imagery for the City of Hartford.

### Project Background

This analysis of Hartford's tree canopy (TC) was conducted in collaboration with the City of Hartford and the USDA Forest Service. It was performed by the Spatial Analysis Laboratory (SAL) at the University of Vermont's Rubenstein School of the Environment and Natural Resources, in consultation with the USDA Forest Service's Northern Research Station.

The goal of the project was to apply the USDA Forest Service's TC assessment protocols to the City of Hartford. The analysis was conducted based on year 2008 data.

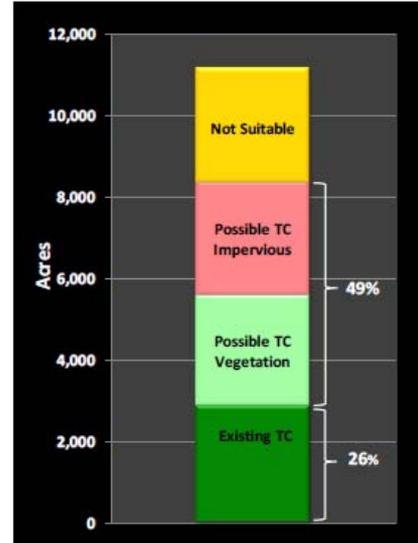

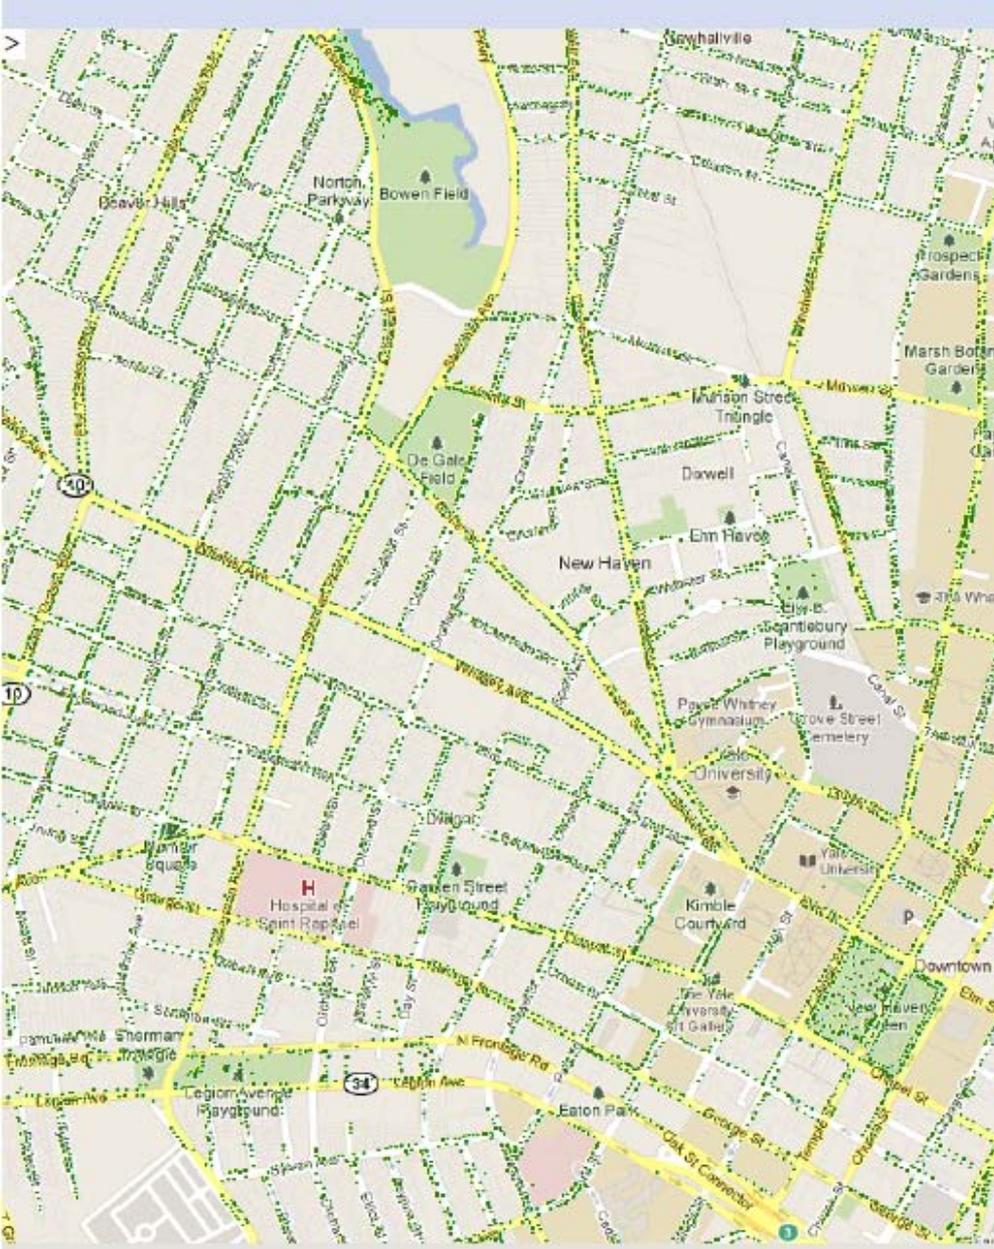

Figure 2: TC metrics for Hartford based on % of land area covered by each TC type.

### Key Terms

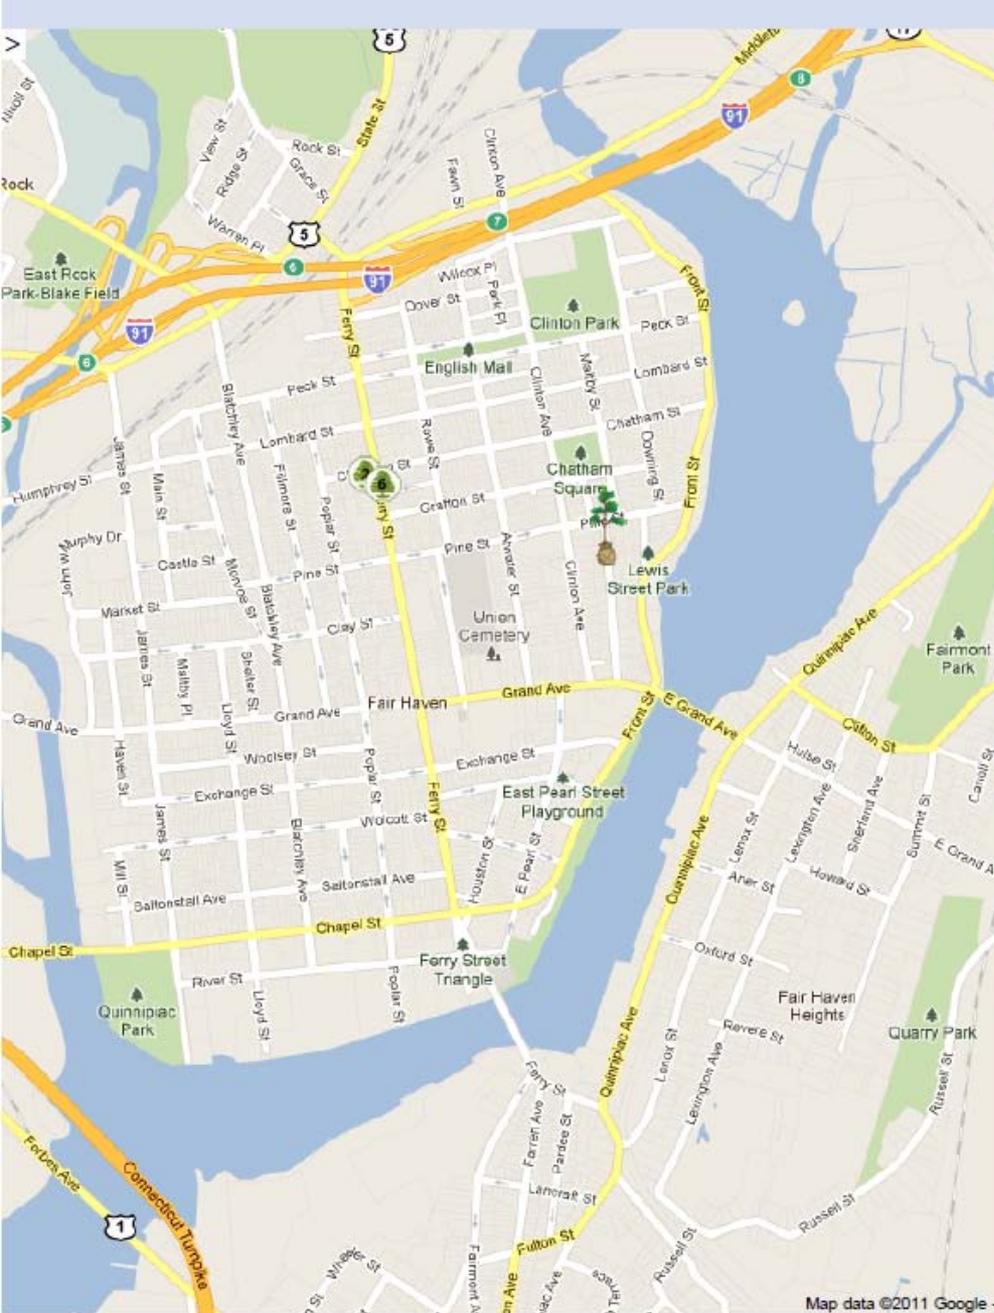

**TC:** Tree canopy (TC) is the layer of leaves, branches, and stems of trees that cover the ground when viewed from above.  
**Land Cover:** Physical features on the earth mapped from aerial or satellite imagery, such as trees, grass, water, and impervious surfaces.  
**Existing TC:** The amount of urban tree canopy present when viewed from above using aerial or satellite imagery.  
**Impervious Possible TC:** Asphalt or concrete surfaces, excluding roads and buildings, that are theoretically available for the establishment of tree canopy.  
**Vegetated Possible TC:** Grass or shrub area that is theoretically available for the establishment of tree canopy.

i-Tree Design Beta

512 Ferry St, New Haven, CT 06513, USA

[Home](#)

Get started with these easy steps:

**Enter your tree's species:**

*Note: If you're looking for a Willow Oak, it's listed as "Oak, Willow". If your tree isn't listed, use the general "Other" listings.*

**Enter how wide (diameter) your tree is at  
4.5 feet above the ground:**  inches.

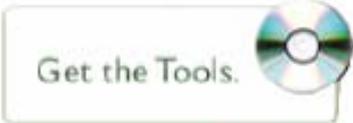

*Note: This measurement is what foresters call "diameter at breast height".*

**Enter what type of condition best describes  
your tree:** **Check here if you would like to  
evaluate energy effects:** 

Bearing:58.3,Distance:8.5m (27.7ft)

Vertices:11; Area:165.3 m<sup>2</sup> (1779.1 ft<sup>2</sup>)

Overall Benefit	Storm Water	Energy	Air Quality	CO2	
-----------------	-------------	--------	-------------	-----	--

- Stormwater
- Air Quality
- CO2
- Cooling
- Heating

### Breakdown of your tree's benefits

Click on one of the tabs above for more detail

**This 16 inch Sugar maple provides overall benefits of: \$65 every year.**

While some functional benefits of trees are well documented, others are difficult to quantify (e.g., human social and communal health). Trees' specific geography, climate, and interactions with humans and infrastructure is highly variable and makes precise calculations that much more difficult. Given these complexities, the results presented here should be considered initial approximations to better understand the environmental and economic value associated with trees and their placement.

Benefits of trees do not account for the costs associated with trees' long-term care and maintenance.

**If this tree is cared for and grows to 21 inches, it will provide \$75 in annual benefits.**

*Thank You*
